

by Corksol—are viable, but the choice largely depends on the specific needs of your heritage property and the condition of the existing wall.

- **Lime Basecoat + Corksol:** A lime basecoat is typically applied as an underlayer for additional builds or finishes. If the wall already has a lime render or is in relatively good shape, this option works well. It provides a smooth, breathable surface for the Corksol application while preserving the structural integrity of the building.
- **Lime Render + Corksol:** If the wall requires a full re-render to address significant issues like cracks or uneven surfaces, using a lime render is often the better choice. Lime render offers the same breathability and flexibility but provides a more robust initial coat that can help stabilize and protect the wall before finishing with Corksol.

To decide the best approach:

1. Assess the wall's current condition.
2. Consider consulting a heritage building specialist or a Corksol-certified professional.
3. Ensure proper compatibility testing to avoid potential adhesion issues
