For: Beech and Yew Tree Works

Item	Description of Work
T1 Group	The two tall and thin multi-limbed 17–20 meter-tall Beech (<i>Fagus Sylvatica</i>) trees closest to the house to undergo a 20% crown reduction (3.5–4 meters) with the removal of any dead or redundant limbs. Emphasis will be placed on pruning long limbs growing over toward the Northwest where they are shading the neighbours garden. Limbs toward the home will be pruned as well to balance. The aim is to leave the trees less dominant, but healthy and balanced.
T2	The next 15 meter tall Beech (<i>Fagus Sylvatica</i>) tree is showing severe rot in the main stem from 7.5 meters upward, so it is recommended that the majority of the tree above this region is dismantled to leave a safe monolith, which will be a habitat for wildlife in the garden.
T3 group	The next three 17-20 meters tall Beech (<i>Fagus Sylvatica</i>) trees are to undergo a 20% crown reduction (3.5-4 meters) with the removal of any dead or redundant limbs.
T4	The 6.5 meter tall Yew (<i>Taxus Baccata</i>) Tree in the front garden will be pruned back by 30 (2-meters) to restore it to a lovely ball shape. There will be a crown lift to 1 meter to allow two new trees to flourish that are currently growing underneath.
