

Dear Sirs

My client would like to take the opportunity to replace her existing windows and external doors.

The focus of manufacture is to retain the current design whilst improving the thermal efficiency by using conservation 'slim' double glazing and weather/draught seals.

Each pane of glass will be individual, offering multi reflectional properties as opposed to having one pane of glass with glazing bars adhered to it.

Shortcomings of the Current Windows –

As well as being inherently thermally inefficient, the frames are rotten in places and have been repaired many times already by previous owners. Several of the opening sashes are sagging badly which causes them to leak and may be a safety issue. We believe they are no longer fit for purpose and would welcome the opportunity to upgrade them with a modern energy-efficient but sympathetic design.
